About ABB

Communications in a complex organization

Power and automation are all around us You will find ABB technology...

orbiting the earth and working beneath it,

crossing oceans and on the sea bed,

in the fields that grow our crops and
packing the food we eat,

on the trains we ride and in the facilities
that process our water,

in the plants that generate our power and
in our homes, offices and factories

ABB digital communications journey so far

Connect emission-free power to the grid?

Naturally.

Power and productivity
for a better world™ **ABB**

Bloomberg BW 2010 Energy Survey, in partnership with ABB

In Q4 2010, Bloomberg Businessweek Research Services surveyed energy professionals to give their views on the key energy issues facing the world today. ABB, the research sponsor, is pleased to make available the findings of the research. Click on any of the links below to access the findings of the survey

[Video highlights](#) | [Key findings \(4\)](#) | [White papers \(3\)](#) | [Podcast \(3\)](#)

The stories

Connecting renewable energy to the grid

Big cities need large amounts of electricity. Renewable power often needs to be transported hundreds or even thousands of kilometers.

Saving energy with ABB drives

The installed base of ABB drives, which control the power consumed by electric motors, saves 180 million tons of carbon dioxide each year

Drinking water from the sea

Water is the cradle of life, but many parts of our planet are critically short of drinking water. ABB water solutions are helping to turn that around.

A new wind for offshore farms

An ABB technology is helping to link the world's most remote offshore wind farm to the grid, with minimal environmental impact.

The best solutions for a busy city

Intelligent building controls, regulating lighting and ventilation, win awards for energy savings in Singapore.

Fuel-efficiency on the high seas

Royal Caribbean is treating its passengers to a smoother ride, and itself to lower fuel costs, with ABB's electric propulsion system.

Refining plant processes

Subsea transformers

ABB's liquid-filled, pressure-compensated subsea transformers are rated for depths up to 3000 meters.

They reduce the high voltage to levels that can be used by pumps, motors and compressors, while providing reliable performance and cost benefits.

Deep sea equipment sets a high benchmark in terms of technology and solutions. ABB started developing the

Step-up transformer

The ABB subsea transformer can be used as a step-up transformer for tidal turbines, ensuring you get the voltage output you need.

ENERGY EFFICIENCY

09th April 2013 15:08, Act: 09/04/2013 15:08

ABB brings revolutionary power saver

With the intelligent lock «Emax 2" ABB brings a product to market, the annual electricity consumption of 1.4 million households can be saved.

Welcome home

SACE Emax 2

Overview | Tools | Application | Pillars | Contacts

SACE Emax 2 is a new series of low voltage air circuit-breakers up to 6300 A. With the ability to efficiently and simply control electrical installations – from the traditional to the more complex – with minimum impact, the new SACE Emax 2 circuit-breakers represent the evolution of a circuit-breaker into a Power Manager.

SACE Emax 2 air circuit-breakers have been designed to manage, with maximum efficiency, all low voltage electrical installations: from industrial plants, naval applications, traditional and renewable power generation installations to buildings, shopping centers, data centers and communication networks.

Achieving maximum efficiency of an electrical installation in order to reduce consumption and waste requires intelligent

Power and productivity for a better world™ **ABB**

Tower Bridge

About Tower Bridge

The operators of London's historic Tower Bridge turned to ABB for an innovative load monitoring system that measures weight distribution across the span. Based on precision feedback from ABB load cells, operators can adjust the bearing points for uniform load. This has resulted in reduced wear and 20 years of additional service life before major bridge maintenance is expected.

ABB's TOSA flash charging electric bus technology wins innovation prize

2014-10-10 - ABB-developed boost charging technology and traction equipment for electric buses recognized at German EBUS Award 2014.

The technology incorporated on TOSA, the first 100% electric articulated bus, was recognized at the EBUS Award 2014 on October 10. TOSA, which has now been in operation in Geneva, Switzerland, for over a year, won the Power Train and Charging Technology categories for its innovative on-board traction system and flash in-route charging. The EBUS Award is selected by a jury of

worldwide recognized experts and the German public transportation association under the patronage of Alexander Dobrindt, Germany's Minister of Transport and Digital Infrastructure.

TOSA (Trolleybus Optimisation Système Alimentation), which carries up to 135 passengers, could represent a viable alternative to diesel-powered urban transportation in the future. The vehicle is charged directly at selected stops on its route with a 15-second, 400-kilowatt energy boost while the passengers enter and leave the vehicle, based on a new type of automatic flash-charging mechanism. The system uses a laser-controlled moving arm, which connects to an overhead receptacle for charging at bus shelters. The charging time is so quick that it does not interfere with the bus schedule and the lack of overhead lines improves the urban environment while providing greater route flexibility. At the end of the bus line a three to four-minute boost enables the full recharge

ABB to enable integration of renewables in Alaskan island microgrid

Innovative solution to enable Kodiak island to integrate more renewable energy and stabilize power supply across its remote and isolated microgrid

Zurich, Switzerland, September 12, 2014 - ABB, the leading power and automation group, will install its PowerStore, an integrated commercial flywheel technology to integrate with a battery system on Kodiak Island in Alaska to enable the integration of more renewable energy from an expanded wind farm to its microgrid and also to address stability challenges that will arise from a crane upgrade being undertaken to enhance its port operations. The project is being undertaken on behalf of Kodiak Electric Association (KEA), an electric cooperative owned by residents of the Island.

Kodiak Island, off Alaska's south coast, is the second largest island in the United States. Its population of 15,000 people live in just seven communities, the largest in the port town of Kodiak. KEA operates a microgrid that generates virtually all of its 28 megawatts (MW) of electricity capacity from hydropower and wind.
